My idea is to create a membership price calculator for the Gymmies website. The script will be added to the homepage and allow users to select a membership plan and enter how many months they want. It will automatically calculate the total cost and display the result on the page. This will make the website more interactive and help visitors understand how much each membership would cost. The goal of this script is to make the Gymmies website more useful and interactive. I want users to be able to calculate their membership costs without having to do the math themselves. It will also display updated information based on the user's selections and make the website feel more like a real fitness platform. First, I will create an external JavaScript file. Then, I will create variables to store the membership name, price, and number of months. Users will be able to select a membership plan and enter how many months they want. The script will use multiplication to calculate the total cost. Finally, I will use DOM methods to select and update elements on the webpage to display the selected membership and total price.
